## On the physical origin of the cosmological constant: planckian fluctuations, decoherence scale and comparison with the Casimir effect.

*Friday, October 18, 2019 11:30 AM (30 minutes)*

In this talk I present a new proposal concerning the nature of the cosmological constant depicted in terms of Planckian fluctuations.

A semi-classical model is presented with a Planckian generalization of the quasi local Misner-Sharp energy. The observed (dressed) value of  $\Lambda$  is fixed at the scale such that an absolute positive minimum for the generalized Misner-Sharp energy is reached: the new physical scale represents the decoherence one at which the crossover to classicality is obtained.

Finally, a comparison with the Casimir effect is discussed.
