Reduced order model of airflow in a room with two unidirectional air diffusers

As part of a broader study on optimal control of ventilation systems based on reduced order models (ROM) for ventilation effectiveness and thermal comfort assessment, a linear ROM was constructed on the example of a room with two unidirectional air diffusers. The reduced order model includes different flows per air diffuser. Airflow and CO₂ distribution within the room were reproduced under the stationary flow assumption. ROM was compared with CFD data in terms of accuracy.
