¹Centre Inria de Paris, France. ²Laboratoire Jacques-Louis Lions, UPMC Sorbonne Universités, France

- Features **maximally correlated** with parameter of interest, minimally correlated with all the others
- Use: monitoring QoI, parameter estimation
- Given **dictionary** of features:

$$\mathcal{D} = \{\text{"common" features, derivatives, integrals, PCA coefficients, ...}\}$$

- Weights on dictionary entries solution of **sparse** optimization problem
- Leads to easier parameter estimation problems
- Applications: electrophysiology, cardiovascular measurements

Cardiac action potential common features

Weights on dictionary entries
